Maxim Integrated's MAX2982 EVKIT (Rev. 5) and the MAX2985x8 EVALUATION KIT with the MAX2986 (Rev. 4) evaluation kits are currently supported.

The M25Pxx and AT45DB011D Flash device options for either of these kits are supported.

Currently, the Maxim SDK's UART loader for the appropriate Flash device must be used to load the initial binaries. The UART loaders for both Flash types are typically supplied with the evaluation kit's MAX298x SDK CD.

The Xcedent XMM0420 Evaluation Kit is currently under development. Code may be generated for the XMM0420, however, automatic MAC address generation is not supported at this time.
